

LogiFlow — Weekly Progress Report

Week 5 | NextGen Forge Technologies Internship | Ref: NFGT/HR/INT/2026/160

Candidate:	Aryan Ajmera	Industry Guide:	Aryan Sharma
Reporting Manager:	Sonia Sharma	Report Date:	August 14, 2026
Project:	LogiFlow — Enterprise Logistics & Warehouse Management Platform		

1. Tasks Completed This Week

Task W5.1 — React App Setup, Authentication UI & Dashboard Shell

- Initialized the frontend with Vite + React (JavaScript), installed and configured Tailwind CSS v3, and installed react-router-dom, axios, react-hook-form, and recharts.
- Built a configured Axios instance with a request interceptor that automatically attaches the JWT Authorization header from localStorage to every outgoing request.
- Built the Login screen using React Hook Form with client-side validation, error display, and full integration with the backend's /api/auth/login endpoint.
- Implemented AuthContext using createContext and useReducer to manage user, token, and isAuthenticated state, with login() and logout() actions and localStorage persistence.
- Resolved a session-persistence race condition on page reload by introducing a loading state and an AUTH_READY reducer action, ensuring ProtectedRoute waits for the auth check to complete before redirecting.
- Built the ProtectedRoute component and full route structure (root redirect, login, protected routes, 404 catch-all) using React Router v6.
- Built the Application Shell: a role-conditional sidebar, a top navigation bar with notification bell and user avatar, and a main content area rendering nested routes via Outlet.

Task W5.2 — KPI Dashboard, Analytics Charts & Notification Panel

- Built the main Dashboard page, fetching data from the Week 4 analytics, vehicle, inventory, and ticket endpoints.
- Implemented 6 KPI metric cards (Total Orders, Active Shipments, Available Vehicles, Low-Stock Items, Open Tickets, Completed Dispatches) via a reusable KpiCard component.
- Implemented three Recharts visualizations: a doughnut chart for shipments by status, a multi-colour bar chart for top 5 products by order volume, and a line chart for orders created over the last 30 days.
- Implemented a Recent Activity feed rendering the 5 most recent Activity Log entries.
- Implemented the Notification dropdown panel in the top navigation bar, fetching unread notifications and toggling visibility on bell-icon click.
- Reworked the Dashboard and Sidebar to be fully role-conditional: role-restricted API calls are only triggered for permitted roles, KPI cards and menu items are shown/hidden based on the logged-in user's role, and the Activity Log section is Administrator-only.

Task W5.3 — Week 5 Integration & Review

- Tested login, sidebar rendering, and Dashboard KPI rendering across multiple roles (Administrator, Customer Support Executive) to confirm role-based visibility works correctly with no crashes or infinite loading states.
- Verified route protection: unauthenticated access to /dashboard correctly redirects to /login; session persists correctly across a full page reload.
- Committed all frontend work to the develop branch and opened a pull request into main.

2. Testing Performed

- Manual browser testing of the full login flow: form validation, invalid credentials, successful login, and token persistence in localStorage.
- Verified the Axios JWT interceptor correctly attaches the Authorization header on outgoing requests.
- Verified session persistence across page reloads after fixing the auth-check race condition.
- Cross-role testing of Sidebar menu visibility and Dashboard KPI card visibility for Administrator and Customer Support Executive roles, confirming correct show/hide behaviour and no broken data-fetch dependencies.
- Verified ProtectedRoute correctly blocks direct URL access to /dashboard when logged out.

3. Blockers Faced

- Initial CORS and port-mismatch issues prevented the frontend from reaching the backend; resolved by installing and configuring the cors package and aligning the frontend's Axios baseUrl with the backend's actual running port.
- A race condition between the async /auth/me session-restore check and ProtectedRoute's redirect logic caused logged-in users to be incorrectly bounced to the login page on refresh; resolved by adding a loading flag to AuthContext.
- The backend's /auth/login response initially returned only a token with no user details, leaving the frontend with no way to determine the logged-in user's role; resolved by extending the login response to include basic user info.
- Role-restricted analytics/inventory/log endpoints caused the Dashboard to hang indefinitely on 'Loading...' for roles without access, since those API calls never resolved; resolved by making data-fetching and the loading guard role-aware.

4. Known Gaps / Notes

- Notification mark-as-read is not yet wired to the dropdown UI (backend endpoints exist and were tested directly in Week 4, but no click handler has been connected yet).
- Sidebar role-conditioning currently covers one example menu item (Warehouses); the remaining menu items to be built in Week 6 onward will need the same treatment.
- Full 5-role dashboard/sidebar testing was scoped to two representative roles (Administrator, Customer Support Executive) rather than all five, consistent with the sampling approach used in Week 4.

5. Plan for Next Week

- Begin Week 6: build Warehouse, Product, Inventory, and Customer Management UI screens (data tables, add/edit modals, detail pages).
- Build the Order Management UI, including the multi-step Create Order wizard and order status timeline.
- Wire up the Notification mark-as-read interaction in the dropdown panel.
