

LogiFlow — Weekly Progress Report

Week 7 | NextGen Forge Technologies Internship | Ref: NFGT/HR/INT/2026/160

Candidate: Aryan Ajmera Industry Guide: Aryan Sharma

Reporting Manager: Sonia Sharma Report Date: August 21, 2026

Project: LogiFlow — Enterprise Logistics & Warehouse Management Platform

1. Tasks Completed This Week

Task W7.1 — Shipment, Fleet, Dispatch & Ticket UI

- Built the Shipment Management screens: a filterable list page and a Shipment Detail page showing origin/destination, a vertical tracking-history timeline, a form to append new tracking events, and forward-only status action buttons (Mark Assigned / In-Transit / Out-for-Delivery / Mark Failed).
- Added a "Create Shipment" action to the Order Detail page (missing entry point for POST /api/shipments), using a simple prompt-based destination-address input.
- Built the Vehicle Management screen (table with colour-coded availability badge, Add/Edit modal) and the Driver Management screen (table with a clickable availability toggle, Add/Edit modal).
- Built the Dispatch Planning screens: an assignment modal (pending shipment + available vehicle + available driver + schedule + route notes), a list page, and a Dispatch Detail page with a Complete Dispatch action.
- Built the Support Ticket screens: list page with status/priority filters and an "assigned to me" toggle, a Create Ticket modal, and a Ticket Detail page with status progression, an Admin-only assignee dropdown, and a comment thread.

Task W7.2 — Reports UI, Activity Log Viewer & Dashboard Enhancements

- Built the Reports & Export page: a report-type selector (Shipment Summary, Order History, Inventory Status, Dispatch Log) with conditional warehouse/date filters shown only where the underlying endpoint actually supports them, a generated HTML table preview, and CSV export (custom utility) and PDF export (jsPDF + html2canvas capturing the preview table) buttons.
- Built the Admin-only Activity Log viewer: paginated table with entity/user/date-range filters and a user-ID-to-name lookup map.
- Extended the main Analytics Dashboard with a horizontal Warehouse Utilisation bar chart and an additional dispatch-count KPI card alongside the existing Completed Dispatches card.

2. Testing Performed

- Full order-to-delivery walkthrough: Confirm Order → Create Shipment → Assign Dispatch → progress shipment through every status → Complete Dispatch, confirming the vehicle and driver both correctly free up at completion.
- Verified the Dispatch assignment modal correctly excludes vehicles/drivers that are already In-Use or unavailable.
- Verified all four Reports & Export report types generate correct data and that both CSV and PDF downloads open with the expected content.
- Verified role-based visibility for Vehicles, Drivers, Dispatches, Shipments, Tickets, and Activity Logs across all five roles.
- Re-tested the full Customer Support ticket lifecycle: create, comment, assign (Admin), and status progression through to Closed.

3. Blockers Faced

- getShipments filtered on a field name (warehouseId) that did not match the Shipment schema's actual field (originWarehouseId), silently returning no results when filtering by warehouse; corrected the field reference.

- Discovered a dual-source-of-truth bug: `Driver.assignedVehicleId` could be set both manually via the Driver form and implicitly via Dispatch creation, allowing a driver's profile to disagree with their actual active dispatch. Resolved by removing manual assignment entirely and making the field fully automatic — set on dispatch creation, cleared on dispatch completion.
- Dispatch completion (`updateDispatches`) set the Shipment to Delivered by writing directly to the document, bypassing the Order auto-sync logic that only existed inside the separate manual shipment-status-update endpoint; the linked Order was not flipping to Delivered as a result. Fixed by duplicating the Order-sync step into the dispatch-completion handler.
- The Dispatch model has no status field, so the Dispatch Detail page had no way to know a dispatch had already been completed and kept showing an active "Complete Dispatch" button; resolved by deriving completion state from the linked shipment's status instead.
- city (Warehouse) and category (Product) filters used exact-match queries instead of the regex partial-match pattern used elsewhere, so a two-letter search returned nothing until the full value was typed; corrected both to use case-insensitive regex.

4. Known Gaps / Notes

- Dispatch confirmations are not yet a notification trigger (only low-stock and shipment-failure are implemented); this is listed in the platform's general capabilities but is not an explicit deliverable in the graded task list, so it has been deliberately deferred.
- Ticket assignment does not currently notify the assignee; same reasoning as above — deferred as out of the graded scope for now.
- The Inventory screen had no "Add Inventory" entry point despite the backend endpoint existing since Week 2; added an Add Inventory modal this week to close a real usability gap ahead of Week 8 testing.
- There is currently no self-service registration screen, matching the spec's Week 5 task list, which only calls for a Login screen. User provisioning is handled by an Administrator via `POST /api/auth/register`. Flagged to the Industry Guide for confirmation on whether a minimal Admin-only "Add User" screen should be added before final submission.

5. Plan for Next Week

- Begin Week 8: run structured end-to-end testing across all five roles, covering the full order-to-delivery lifecycle multiple times and the boundary cases called out in the spec (zero-stock orders, duplicate SKUs, expired-JWT handling, unauthorized route access).
- Maintain a structured bug log and resolve all Critical/High severity issues found during the sweep.
- Rebuild a clean, coherent test dataset across all modules ahead of final testing and deployment.
- Move on to production deployment: MongoDB Atlas production user and network access, Render backend deployment, and Vercel frontend deployment, followed by post-deployment validation of all five login flows.
